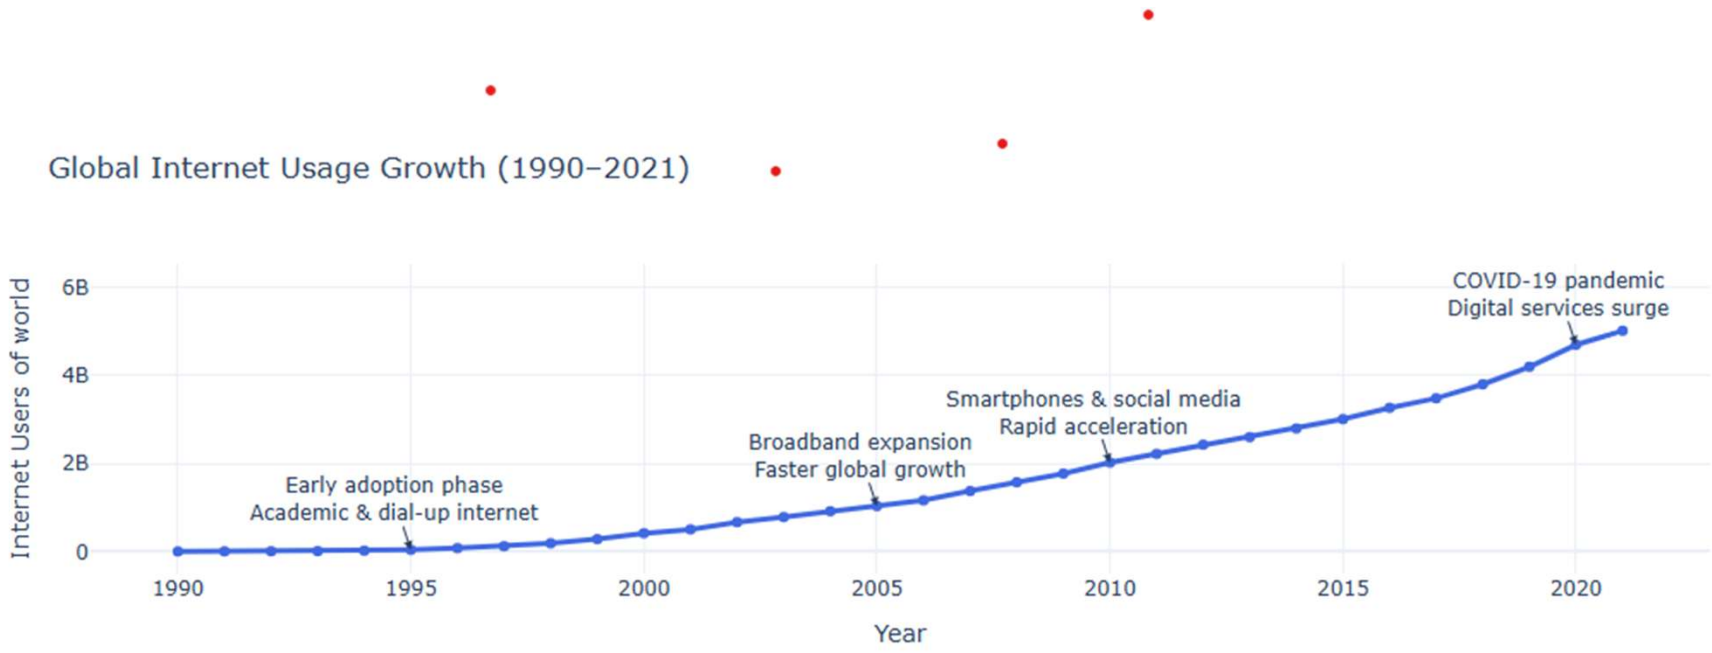
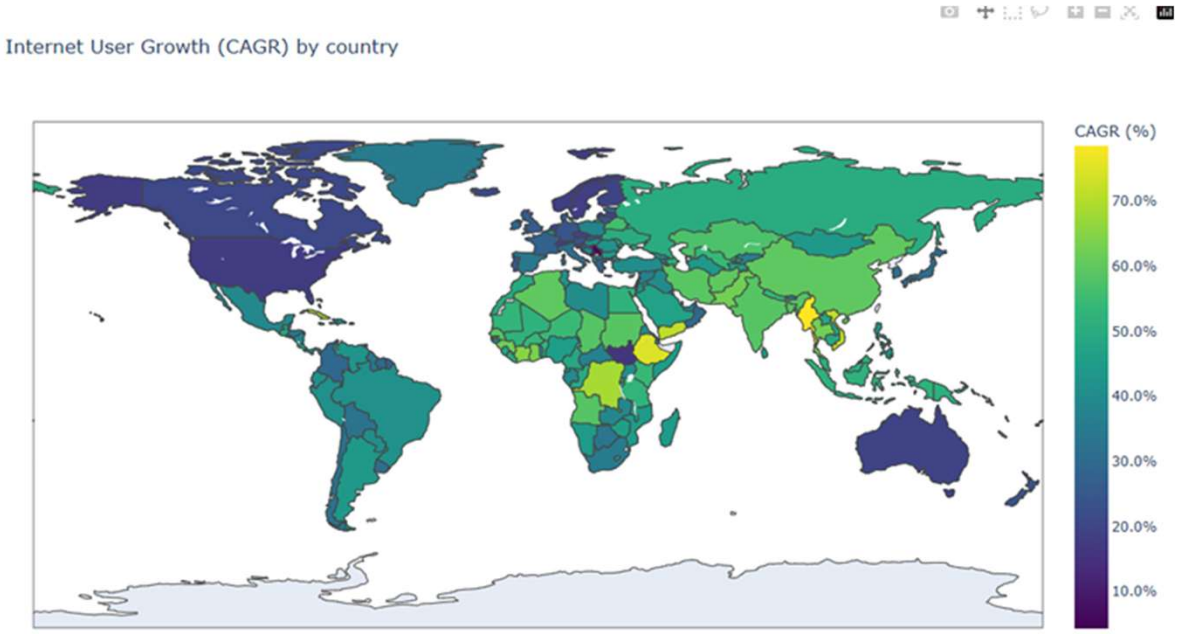
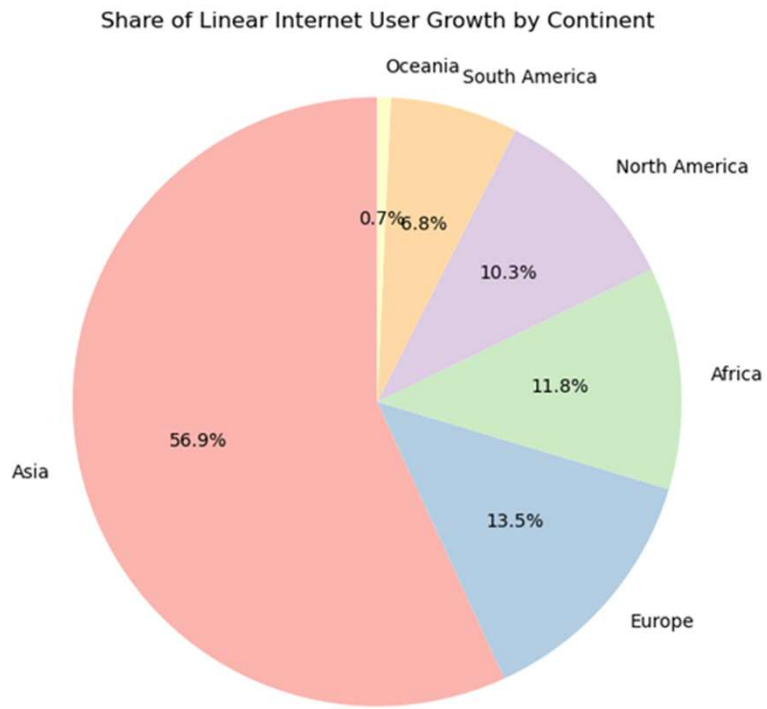
Global Internet Usage

How has global internet usage evolved over time?

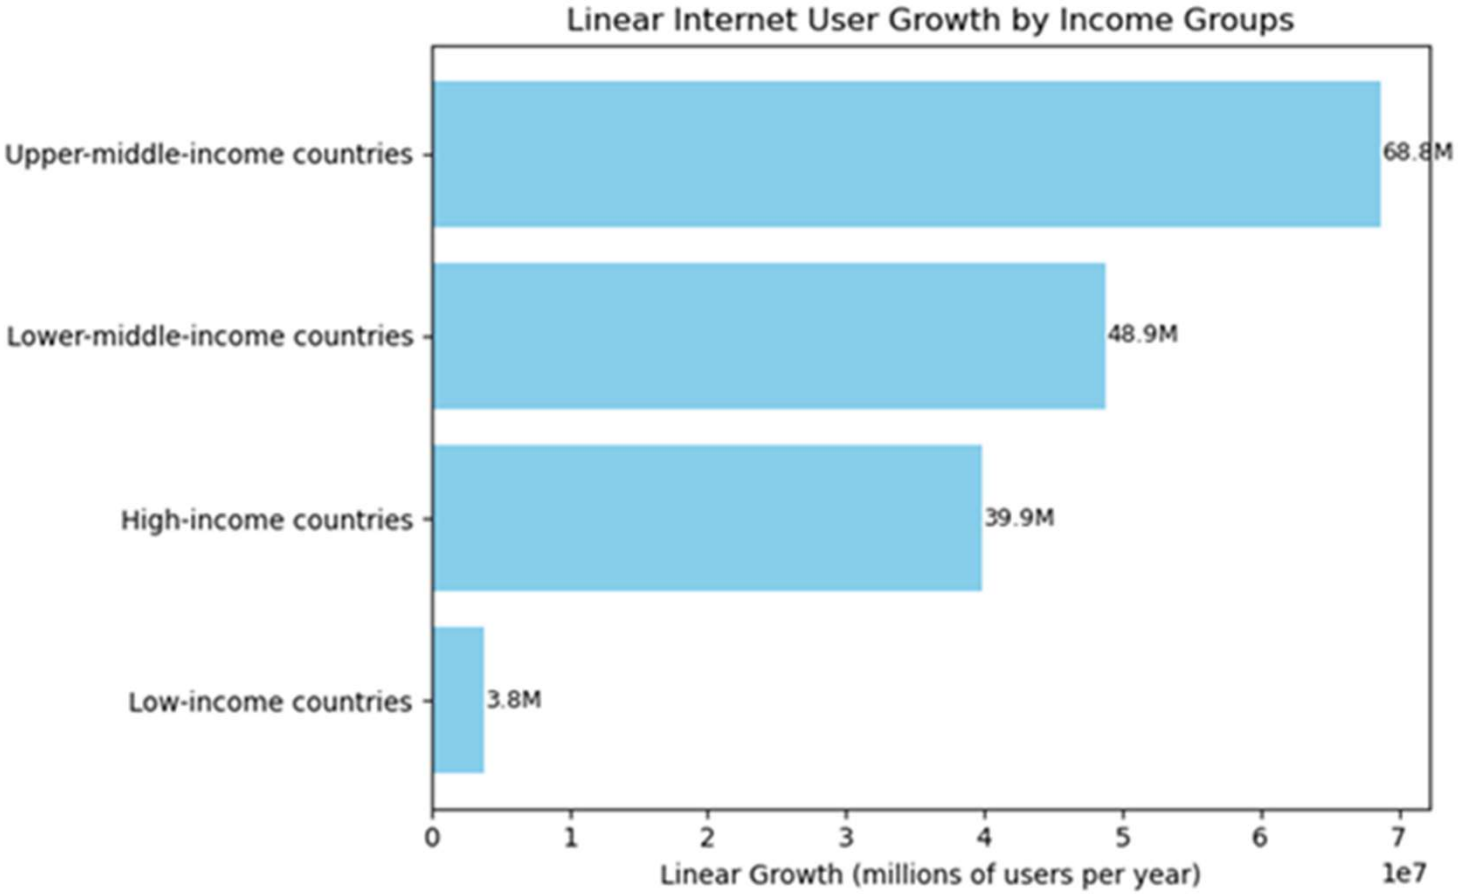


Global internet usage by continent and country





Global internet usage by income groups



Expected pattern of world internet growth from 2021 to 2031

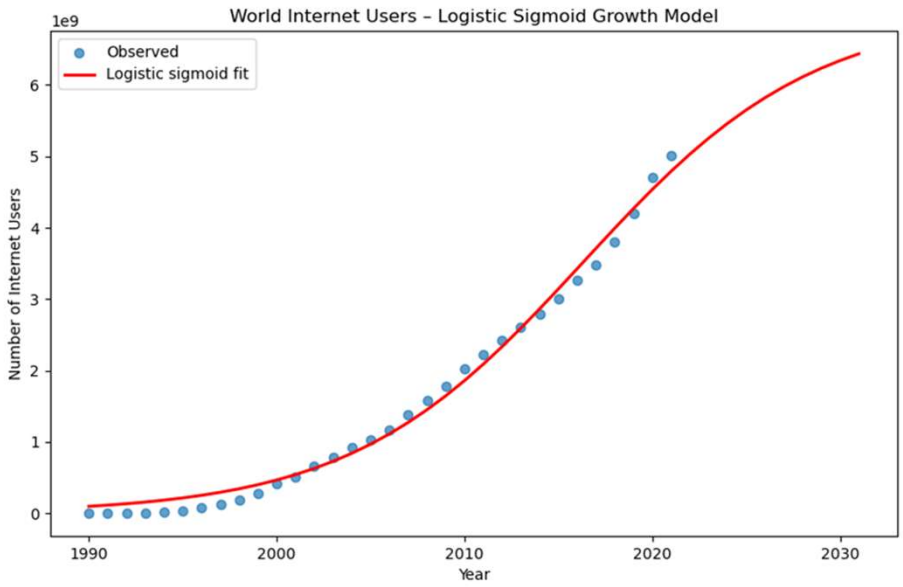
Conclusion

The logistic sigmoid model produced an RMSE of ~131 million users and a relative error of ~8.3%, indicating a reasonably good fit to historical data.

Forecasts align closely with real-world 2025 estimates of 5.5–6 billion global internet users.

The model successfully captures the S-shaped adoption curve and provides stable long-term predictions.

Overall, it is suitable for modelling and understanding global internet growth trends.



Insights

- Internet growth across continents, countries and income groups.
- Asia contributes the largest share of new internet users
- Europe and North America add fewer users as markets are closer to saturation.
- Africa and South America show the fastest growth, indicating rapid expansion from later adoption.
- Lower- and lower-middle-income countries grow faster than high-income countries
- Future growth: developing regions.
